## Mechanics of Machining

## Lesson

 8 Machining forces and Merchant's Circle Diagram (MCD)
## Instructional Objectives

At the end of this lesson, the student would be able to
(i) Ascertain the benefits and state the purposes of determining cutting forces
(ii) Identify the cutting force components and conceive their significance and role
(iii) Develop Merchant's Circle Diagram and show the forces and their relations
(iv) Illustrate advantageous use of Merchant's Circle Diagram

## (i) Benefit of knowing and purpose of determining cutting forces.

The aspects of the cutting forces concerned :

- Magnitude of the cutting forces and their components
- Directions and locations of action of those forces
- Pattern of the forces : static and / or dynamic.

Knowing or determination of the cutting forces facilitate or are required for :

- Estimation of cutting power consumption, which also enables selection of the power source(s) during design of the machine tools
- Structural design of the machine - fixture - tool system
- Evaluation of role of the various machining parameters ( process $\mathrm{V}_{\mathrm{c}}, \mathrm{s}_{\mathrm{o}}, \mathrm{t}$, tool - material and geometry, environment - cutting fluid) on cutting forces
- Study of behaviour and machinability characterisation of the work materials
- Condition monitoring of the cutting tools and machine tools.

## (ii) Cutting force components and their significances

The single point cutting tools being used for turning, shaping, planing, slotting, boring etc. are characterised by having only one cutting force during machining. But that force is resolved into two or three components for ease of analysis and exploitation. Fig. 8.1 visualises how the single cutting force in turning is resolved into three components along the three orthogonal directions; $\mathrm{X}, \mathrm{Y}$ and Z .
The resolution of the force components in turning can be more conveniently understood from their display in 2-D as shown in Fig. 8.2.

Fig. 8.1 Cutting force $R$ resolved into $P_{X}, P_{Y}$ and $P_{Z}$

Fig. 8.2 Turning force resolved into $P_{Z}, P_{X}$ and $P_{Y}$

The resultant cutting force, R is resolved as,

$$
\begin{align*}
\bar{R} & =\bar{P}_{Z}+\bar{P}_{X Y}  \tag{8.1}\\
\text { and } \quad \bar{P}_{X Y} & =\bar{P}_{X}+\bar{P}_{Y}  \tag{8.2}\\
\text { where, } \mathrm{P}_{X} & =\mathrm{P}_{X Y} \sin \phi \text { and } \quad \mathrm{P}_{Y}=\mathrm{P}_{X Y} \cos \phi \\
\text { where, } \mathrm{P}_{Z} & =\text { tangential component taken in the direction of } Z_{m} \text { axis } \\
\mathrm{P}_{X} & =\text { axial component taken in the direction of longitudinal } \\
& \quad \text { feed or } \mathrm{X}_{\mathrm{m}} \text { axis } \\
\mathrm{P}_{Y} & =\text { radial or transverse component taken along } \mathrm{Y}_{\mathrm{m}} \text { axis. }
\end{align*}
$$

In Fig. 8.1 and Fig. 8.2 the force components are shown to be acting on the tool. A similar set of forces also act on the job at the cutting point but in opposite directions as indicated by $P_{Z^{\prime}}, P_{X y^{\prime}}, P_{x}{ }^{\prime}$ and $P_{y^{\prime}}$ in Fig. 8.2

## Significance of $P_{Z}, P_{X}$ and $P_{Y}$

$P_{z}$ : called the main or major component as it is the largest in magnitude. It is also called power component as it being acting along and being multiplied by $\mathrm{V}_{\mathrm{C}}$ decides cutting power ( $\mathrm{P}_{\mathrm{z}} . \mathrm{V}_{\mathrm{C}}$ ) consumption.
$P_{y}$ : may not be that large in magnitude but is responsible for causing dimensional inaccuracy and vibration.
$P_{X}:$ It, even if larger than $P_{Y}$, is least harmful and hence least significant.

## Cutting forces in drilling

In a drill there are two main cutting edges and a small chisel edge at the centre as shown in Fig. 8.3.
The force components that develop (Fig. 8.3) during drilling operation are :

- a pair of tangential forces, $\mathrm{P}_{\mathrm{T} 1}$ and $\mathrm{P}_{\mathrm{T} 2}$ (equivalent to $\mathrm{P}_{\mathrm{Z}}$ in turning) at the main cutting edges
- axial forces $P_{x 1}$ and $P_{x 2}$ acting in the same direction
- a pair of identical radial force components, $P_{Y 1}$ and $P_{Y 2}$
- one additional axial force, $P_{x e}$ at the chisel edge which also removes material at the centre and under more stringent condition.
$\mathrm{P}_{\mathrm{T} 1}$ and $\mathrm{P}_{\mathrm{T} 2}$ produce the torque, T and causes power consumption $\mathrm{P}_{\mathrm{C}}$ as,

$$
\begin{equation*}
\mathrm{T}=\mathrm{P}_{\mathrm{T}} \times 1 / 2(\mathrm{D}) \tag{8.3}
\end{equation*}
$$

and $P_{C}=2 \pi \mathrm{TN}$
where, $\mathrm{D}=$ diameter of the drill
and $\quad \mathrm{N}=$ speed of the drill in rpm.
The total axial force $P_{x T}$ which is normally very large in drilling, is provided by

$$
\begin{equation*}
P_{x T}=P_{x 1}+P_{x 2}+P_{x e} \tag{8.5}
\end{equation*}
$$

But there is no radial or transverse force as $P_{Y_{1}}$ and $P_{Y 2}$, being in opposite direction, nullify each other if the tool geometry is perfectly symmetrical.

Fig. 8.3 Cutting forces in drilling.

## Cutting forces in milling

The cutting forces (components) developed in milling with straight fluted slab milling cutter under single tooth engagement are shown in Fig. 8.4.
The forces provided by a single tooth at its angular position, $\psi_{\mathrm{I}}$ are :

- Tangential force $\mathrm{P}_{\mathrm{Ti}}$ (equivalent to $\mathrm{P}_{\mathrm{Z}}$ in turning)
- Radial or transverse force, $\mathrm{P}_{\mathrm{Ri}}$ (equivalent to $\mathrm{P}_{\mathrm{XY}}$ in turning)
- $R$ is the resultant of $P_{T}$ and $P_{R}$
- $R$ is again resolved into $P_{Z}$ and $P_{Y}$ as indicated in Fig. 8.4 when $Z$ and $Y$ are the major axes of the milling machine.

Those forces have the following significance:
o $\mathrm{P}_{\mathrm{T}}$ governs the torque, T on the cutter or the milling arbour as

$$
\begin{equation*}
\mathrm{T}=\mathrm{P}_{\mathrm{T}} \times \mathrm{D} / 2 \tag{8.5}
\end{equation*}
$$

and also the power consumption, $\mathrm{P}_{\mathrm{C}}$ as

$$
\begin{equation*}
\mathrm{P}_{\mathrm{C}}=2 \pi \mathrm{TN} \tag{8.6}
\end{equation*}
$$

where, $\mathrm{N}=\mathrm{rpm}$ of the cutter.
The other forces, $\mathrm{P}_{\mathrm{R}}, \mathrm{P}_{\mathrm{Z}}, \mathrm{P}_{\mathrm{Y}}$ etc are useful for design of the Machine - Fixture - Tool system.
In case of multitooth engagement;
Total torque will be $\mathrm{D} / 2 . \sum \mathrm{P}_{\mathrm{Ti}}$ and total force in Z and Y direction will be $\sum \mathrm{P}_{Z}$ and $\sum \mathrm{P}_{Y}$ respectively.

One additional force i.e. axial force will also develop while milling by helical fluted cutter

Fig. 8.4 Cutting forces developed in plain milling (with single tooth engagement)

## (iii) Merchant's Circle Diagram and its use

In orthogonal cutting when the chip flows along the orthogonal plane, $\pi_{0}$, the cutting force (resultant) and its components $P_{Z}$ and $P_{X Y}$ remain in the orthogonal plane. Fig. 8.5 is schematically showing the forces acting on a piece of continuous chip coming out from the shear zone at a constant speed. That chip is apparently in a state of equilibrium.

Fig. 8.5 Development of Merchants Circle Diagram.

The forces in the chip segment are :
o From job-side :

- $\mathrm{P}_{\mathrm{s}}$ - shear force and
- $P_{\mathrm{n}}$ - force normal to the shear force
where, $\overline{P_{s}}+\overline{P_{n}}=\bar{R}$ (resultant)
o From tool side :
- $\overline{R_{1}}=\bar{R}$ (in state of equilibrium)
- where $\overline{R_{1}}=\bar{F}+\bar{N}$
- $\mathrm{N}=$ force normal to rake face
- $F=$ friction force at chip tool interface.

The resulting cutting force R or $\mathrm{R}_{1}$ can be resolved further as

$$
\overline{R_{1}}=\overline{P_{Z}}+\overline{P_{X Y}}
$$

where, $P_{z}=$ force along the velocity vector
and $\quad P_{X Y}=$ force along orthogonal plane.
The circle(s) drawn taking R or $\mathrm{R}_{1}$ as diameter is called Merchant's circle which contains all the force components concerned as intercepts. The two circles with their forces are combined into one circle having all the forces contained in that as shown by the diagram called Merchant's Circle Diagram (MCD) in Fig. 8.6

Fig. 8.6 Merchant's Circle Diagram with cutting forces.

The significance of the forces displayed in the Merchant's Circle Diagram are : $P_{S}$ - the shear force essentially required to produce or separate the
chip from the parent body by shear
$P_{n}$ - inherently exists along with $P_{S}$
F - friction force at the chip tool interface
N - force acting normal to the rake surface
$\mathrm{P}_{\mathrm{z}}$ - main force or power component acting in the direction of cutting velocity
$P_{X Y}-\bar{P}_{X}+\bar{P}_{Y}$
The magnitude of $P_{s}$ provides the yield shear strength of the work material under the cutting condition.
The values of $F$ and the ratio of $F$ and $N$ indicate the nature and degree of interaction like friction at the chip-tool interface. The force components $\mathrm{P}_{\mathrm{X}}, \mathrm{P}_{\mathrm{Y}}$, $P_{z}$ are generally obtained by direct measurement. Again $P_{z}$ helps in determining cutting power and specific energy requirement. The force components are also required to design the cutting tool and the machine tool.

## (iv) Advantageous use of Merchant's Circle Diagram (MCD)

Proper use of MCD enables the followings :

- Easy, quick and reasonably accurate determination of several other forces from a few known forces involved in machining
- Friction at chip-tool interface and dynamic yield shear strength can be easily determined
- Equations relating the different forces are easily developed.

## Some limitations of use of MCD

- Merchant's Circle Diagram(MCD) is valid only for orthogonal cutting
- by the ratio, F/N, the MCD gives apparent (not actual) coefficient of friction
- It is based on single shear plane theory.

The advantages of constructing and using MCD has been illustrated as by an example as follows ;
Suppose, in a simple straight turning under orthogonal cutting condition with given speed, feed, depth of cut and tool geometry, the only two force components $\mathrm{P}_{\mathrm{z}}$ and $\mathrm{P}_{\mathrm{x}}$ are known by experiment i.e., direct measurement, then how can one determine the other relevant forces and machining characteristics easily and quickly without going into much equations and calculations but simply constructing a circle-diagram. This can be done by taking the following sequential steps :

- Determine $P_{X Y}$ from $P_{X}=P_{X Y} \sin \phi$, where $P_{X}$ and $\phi$ are known.
- Draw the tool and the chip in orthogonal plane with the given value of $\gamma_{0}$ as shown in Fig. 8.4
- Choose a suitable scale ( e.g. $100 \mathrm{~N}=1 \mathrm{~cm}$ ) for presenting $P_{z}$ and $P_{X Y}$ in cm
- Draw $P_{Z}$ and $P_{X Y}$ along and normal to $\overline{V_{C}}$ as indicated in Fig. 8.6
- Draw the cutting force $R$ as the resultant of $P_{Z}$ and $P_{X Y}$
- Draw the circle (Merchant's circle) taking R as diameter
- Get F and N as intercepts in the circle by extending the tool rake surface and joining tips of $F$ and $R$
- Divide the intercepts of $F$ and $N$ by the scale and get the values of $F$ and N
- For determining $P_{s}$ (and $P_{n}$ ) the value of the shear angle $\beta_{o}$ has to be evaluated from

$$
\tan \beta_{o}=\frac{\cos \gamma_{o}}{\zeta-\sin \gamma_{o}}
$$

where $\gamma_{0}$ is known and $\zeta$ has to be obtained from

$$
\zeta=\frac{a_{2}}{a_{1}} \text { where } a_{1}=\mathrm{s}_{0} \sin \phi
$$

$\mathrm{S}_{0}$ and $\phi$ are known and $\mathrm{a}_{2}$ is either known, if not, it has to be measured by micrometer or slide calliper

- Draw the shear plane with the value of $\beta_{o}$ and then $P_{s}$ and $P_{n}$ as intercepts shown in Fig. 8.6.
- Get the values of $P_{s}$ and $P_{n}$ by dividing their corresponding lengths by the scale
- Get the value of apparent coefficient of friction, $\mu_{\mathrm{a}}$ at the chip tool interface simply from the ratio, $\mu_{a}=\frac{F}{N}$
- Get the friction angle, $\eta$, if desired, either from tan $\eta=\mu_{a}$ or directly from the MCD drawn as indicated in Fig. 8.6.
- Determine dynamic yield shear strength ( $\tau_{\mathrm{s}}$ ) of the work material under the cutting condition using the simple expression

$$
\tau_{s}=\frac{P_{s}}{A_{s}}
$$

where, $\mathrm{A}_{\mathrm{s}}=$ shear area as indicated in Fig. 8.7

$$
\begin{aligned}
& =\frac{a_{1} b_{1}}{\sin \beta_{o}}=\frac{t s_{o}}{\sin \beta_{o}} \\
& \mathrm{t}=\text { depth of cut (known) }
\end{aligned}
$$

Fig. 8.7 Shear area in orthogonal turning

## Evaluation of cutting power consumption and specific energy requirement

Cutting power consumption is a quite important issue and it should always be tried to be reduced but without sacrificing MRR.
Cutting power consumption, $\mathrm{P}_{\mathrm{C}}$ can be determined from,

$$
\begin{equation*}
\mathrm{P}_{\mathrm{C}}=\mathrm{P}_{\mathrm{z}} \cdot \mathrm{~V}_{\mathrm{C}}+\mathrm{P}_{\mathrm{x}} \cdot \mathrm{~V}_{\mathrm{f}} \tag{8.4}
\end{equation*}
$$

where, $\mathrm{V}_{\mathrm{f}}=$ feed velocity

$$
=\mathrm{Ns} \mathrm{o}_{0} / 1000 \mathrm{~m} / \mathrm{min}[\mathrm{~N}=\mathrm{rpm}]
$$

Since both $P_{x}$ and $V_{f}$, specially $V_{f}$ are very small, $P_{x} . V_{f}$ can be neglected and then $\mathrm{P}_{\mathrm{C}} \cong \mathrm{P}_{\mathrm{z}} \cdot \mathrm{V}_{\mathrm{C}}$
Specific energy requirement, which means amount of energy required to remove unit volume of material, is an important machinability characteristics of the work material. Specific energy requirement, $\mathrm{U}_{\mathrm{s}}$, which should be tried to be reduced as far as possible, depends not only on the work material but also the process of the machining, such as turning, drilling, grinding etc. and the machining condition, i.e., $\mathrm{V}_{\mathrm{C}}, \mathrm{S}_{\mathrm{o}}$, tool material and geometry and cutting fluid application.
Compared to turning, drilling requires higher specific energy for the same work-tool materials and grinding requires very large amount of specific energy for adverse cutting edge geometry (large negative rake).
Specific energy, $U_{s}$ is determined from

$$
U_{s}=\frac{P_{Z} \cdot V_{C}}{M R R}=\frac{P_{Z}}{t s_{o}}
$$

## Exercise - 8 <br> Solution of some Problems

## Problem 1

During turning a ductile alloy by a tool of $\gamma_{0}=10^{\circ}$, it was found $\mathrm{P}_{\mathrm{Z}}=1000 \mathrm{~N}$, $P X=400 \mathrm{~N}, \mathrm{P}_{\mathrm{Y}}=300 \mathrm{~N}$ and $\zeta=2.5$. Evaluate, using MCD, the values of $\mathrm{F}, \mathrm{N}$ and $\mu$ as well as $P_{S}$ and $P_{n}$ for the above machining.

## Solution :

- force, $P_{X Y}=\sqrt{P_{X}^{2}+P_{Y}^{2}}=\sqrt{(400)^{2}+(300)^{2}}=500 \mathrm{~N}$
- Select a scale: $1 \mathrm{~cm}=200 \mathrm{~N}$
- Draw the tool tip with $\gamma_{0}=10^{\circ}$ In scale, $\mathrm{P}_{\mathrm{Z}}=1000 / 200=5 \mathrm{~cm}$ and $\mathrm{P}_{\mathrm{XY}}=500 / 200=2.5 \mathrm{~cm}$
- Draw $P_{Z}$ and $P_{X Y}$ in the diagram
- Draw R and then the MCD
- Extend the rake surface and have F and N as shown
- Determine shear angle, $\beta_{0}$

$$
\begin{aligned}
\tan \beta_{0} & =\cos \gamma_{0} /\left(\zeta-\sin \gamma_{0}\right) \\
& =\cos 10^{\circ} /\left(2.5-\sin 10^{\circ}\right)=0.42 \\
\beta_{0} & =\tan ^{-1}(0.42)=23^{\circ}
\end{aligned}
$$

- Draw $P_{s}$ and $P_{n}$ in the MCD
- From the MCD, find F $=3 \times 200=600 \mathrm{~N} ; \mathrm{N}=4.6 \times 200=920 \mathrm{~N}$;

$$
\begin{aligned}
\mu & =\mathrm{F} / \mathrm{N}=600 / 920=0.67 \\
\mathrm{P}_{\mathrm{S}} & =3.4 \times 200=680 ; \quad \mathrm{P}_{\mathrm{n}}=4.3 \times 200=860 \mathrm{~N}
\end{aligned}
$$

## Problem 2

During turning a steel rod of diameter 160 mm at speed 560 rpm , feed 0.32 $\mathrm{mm} / \mathrm{rev}$. and depth of cut 4.0 mm by a ceramic insert of geometry

$$
0^{0},-10^{0}, 6^{0}, 6^{0}, 15^{0}, 75^{0}, 0(\mathrm{~mm})
$$

The followings were observed:
$P z=1600 \mathrm{~N}, \mathrm{Px}=800 \mathrm{~N}$ and chip thickness=1mm. Determine with the help of MCD the possible values of $\mathrm{F}, \mathrm{N}, \mathrm{m}_{\mathrm{a}}, \mathrm{P}_{\mathrm{S}}, \mathrm{P}_{\mathrm{n}}$, cutting power and specific energy consumption.

## Solution

- PXY=PX/sin $=800 / \sin 75^{\circ}=828 \mathrm{~N}$
- Select a scale: $1 \mathrm{~cm}=400 \mathrm{~N}$
- Draw the tool tip with $\gamma_{\mathrm{o}}=-10^{0}$
- Draw PZ and PXY in scale as shown
- Draw resultant and MCD
shear angle, $\beta_{0}$

$$
\tan \beta_{0}=\cos \gamma_{0} /\left(\zeta-\sin \gamma_{0}\right)
$$

where, $\quad \zeta=\mathrm{a}_{2} / \mathrm{a}_{1}=\mathrm{a}_{2} /\left(\mathrm{s}_{0} \sin \phi\right)=3.2$

$$
\beta_{0}=\tan ^{-1}\left(\cos \left(-10^{\circ}\right)\right) /\left\{\left(3.2-\sin \left(-10^{\circ}\right)\right)\right\}=16.27^{\circ}
$$

- Draw $P_{S}$ and $P_{n}$ as shown
- Using the scale and intercepts determine

$$
\begin{aligned}
& \mathrm{F}=1.75 \times \text { scale }=700 \mathrm{~N} \\
& \mathrm{~N}=4.40 \times \text { scale }=1760 \mathrm{~N} \\
& \mu_{\mathrm{a}}=\mathrm{F} / \mathrm{N}=700 / 1760=0.43 \\
& \mathrm{P}_{\mathrm{S}}=3.0 \times \text { scale }=1200 \mathrm{~N} \\
& \mathrm{P}_{\mathrm{n}}=3.3 \times \text { scale }=1320 \mathrm{~N}
\end{aligned}
$$

- Cutting Power, $\mathrm{P}_{\mathrm{C}} \quad \mathrm{P}_{\mathrm{C}}=\mathrm{P}_{\mathrm{Z}} . \mathrm{V}_{\mathrm{C}}$ where

$$
\mathrm{V}_{\mathrm{C}}=\pi \mathrm{DN} / 1000=\pi \times 160 \times 560 / 1000=281.5 \mathrm{~m} / \mathrm{min}
$$

So, $\mathrm{P}_{\mathrm{C}}=8 \mathrm{KW}$.

- $\quad$ Specific energy $=P Z /\left(\mathrm{ts}_{0}\right)=1600 /(4 \times 0.32)=1250 \mathrm{~N}-\mathrm{mm} / \mathrm{mm}^{3}$

## Problem 3

For turning a given steel rod by a tool of given geometry if shear force PS , frictional force $F$ and shear angle $\gamma_{0}$ could be estimated to be 400 N and 300 N respectively, then what would be the possible values of $\mathrm{P}_{X} \mathrm{P}_{Y}$ and $\mathrm{P}_{Z}$ ?
[use MCD]

## Solution:

- tool geometry is known. Let rake angle be $\gamma_{o}$ and principal cutting edge angle be $\phi$.
- Draw the tool tip with the given value of $\gamma_{0}$ as shown.
- Draw shear plane using the essential value of $\beta_{0}$
- using a scale (let 1cm=400N) draw shear force Ps and friction force $F$ in the respective directions.
- Draw normals on PS and F at their tips as shown and let the normals meet at a point.
- Join that meeting point with tool tip to get the resultant force
- Based on resultant force R draw the MCD and get intercepts for $\mathrm{P}_{\mathrm{Z}}$ and $P_{x y}$
- Determine $P_{z}$ and $P_{x y}$ from the MCD
- $P_{Z}=\ldots \times$ scale $=$ - $P_{x y}=\ldots x$ scale $=$ $\qquad$
- $P_{Y}=P_{X Y} \cos \phi$
- $P_{X}=P_{X Y} \sin \phi$

## Problem - 4

During shaping like single point machining/turning) a steel plate at feed, 0.20 $\mathrm{mm} /$ stroke and depth 4 mm by a tool of $\lambda=\gamma=0^{\circ}$ and $\phi=90^{\circ} \mathrm{PZ}$ and PX were found (measured by dynamometer) to be 800 N and 400 N respectively, chip thickness, $\mathrm{a}_{2}$ is 0.4 mm . From the aforesaid conditions and using Merchant's Circle Diagram determine the yield shear strength of the work material in the machining condition?

## Solution

- It is orthogonal $\left(\lambda=0^{\circ}\right)$ cutting $\backslash \mathrm{MCD}$ is valid
- draw tool with $\gamma_{0}=0^{0}$ as shown
- $P X Y=P_{X} / \sin \phi=400 / \sin 90^{\circ}=400 \mathrm{~N}$
- Select a scale : $1 \mathrm{~cm}=200 \mathrm{~N}$
- Draw PZ and PXY using that scale

$$
\begin{aligned}
& P_{Z}=800 / 200=4 \mathrm{~cm} \\
& P_{X Y}=400 / 200=2 \mathrm{~cm}
\end{aligned}
$$

- Get R and draw the MCD
- Determine shear angle, $\beta_{o}$ from

$$
\begin{aligned}
\tan \beta_{0} & =\cos \gamma_{0} /\left(\zeta-\sin \gamma_{0}\right), \gamma_{0}=00 \text { and } \\
\zeta & =a_{2} / a_{1} a_{1}=\left(s_{0} \sin \phi\right)=0.2 \times \sin 90^{\circ}=0.2 \\
\beta_{0} & =\tan ^{-1}(0.2 / 0.4)=26^{\circ}
\end{aligned}
$$

- Draw $P_{S}$ along the shear plane and find $P_{S}=2.5 \times 200=500 \mathrm{~N}$
- Now, $\tau_{\mathrm{S}}=\mathrm{P}_{\mathrm{S}} / \mathrm{A}_{\mathrm{S}}$;

$$
\begin{aligned}
\mathrm{A}_{\mathrm{S}} & =\left(\mathrm{ts} \mathrm{~s}_{\mathrm{O}}\right) / \sin \beta_{\mathrm{o}}=4 \times 0.2 / \sin 260=1.82 \mathrm{~mm}^{2} \\
\text { or, } \tau_{\mathrm{S}} & =500 / 1.82 \\
& =274.7 \mathrm{~N} / \mathrm{mm}^{2}
\end{aligned}
$$
